Words of Wisdom

... nothing lasts forever

„The only constant in life is change”

Heraclitus

<https://crossroadsantigua.org/the-only-constant-in-life-is-change-heraclitus/>

Quality Requirements

- stable
- extensible
- scaleable
- usable

Start with a **Desktop-Icon**
not by command-line

- free of Malware
Codesigning
MacOS – Notarization

- portable
easy to install on different platforms

Linux	(shell-Script & tar-Content)
MS Windows	(InnoSetup)
MacOS	(Disk Image, .dmg)

Troublemaker

```

rattleCAD-4.3.22-Professional.app/Contents/MacOS/rattleCAD_4.3-MacOS.sh

```
#!/bin/sh
cd "${0%/*}"
exec ./vanillawish-20240307-macosx-x86_64 rattleCAD-4.3.22-Professional.kit $@
```

Findings

MacOS Binaries:

- Mach-O Universal / Fat Binaries
 - Container for arm64 & x86_64 Binaries

MacOS Notarization - Process:

- ... does not allow Binaries with Payloads
- ... does not allow Shell-Scripts

Conclusion:

- No
 - tclkit
 - zip-kit (e.g. vanillawish)
 - shell-Script

```
otool -L ../Wish
```

```
./build/myApp.app/Contents/MacOS/Wish (architecture x86_64) :
```

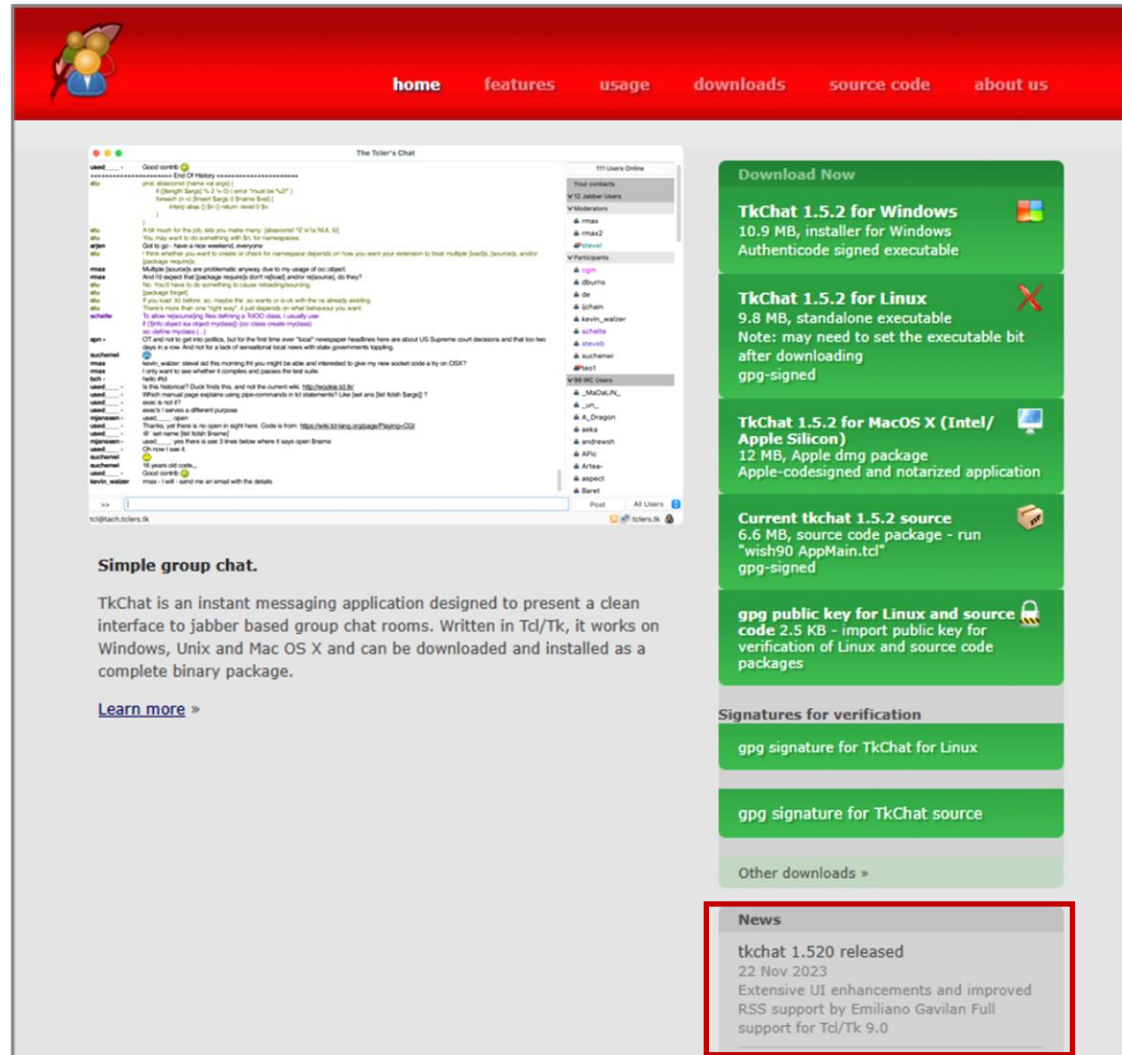

```
@executable_path/../Frameworks/Tk.framework/Versions/8.6/Tk  
@executable_path/../Frameworks/Tcl.framework/Versions/8.6/Tcl  
/usr/lib/libSystem.B.dylib  
/System/Library/...
```

```
./build/myApp.app/Contents/MacOS/Wish (architecture arm64) :
```

```
@executable_path/../Frameworks/Tk.framework/Versions/8.6/Tk  
@executable_path/../Frameworks/Tcl.framework/Versions/8.6/Tcl  
/usr/lib/libSystem.B.dylib  
/System/Library/...
```

Solution Approach

Borrow Approach from: TkChat 1.5.2

Frameworks:

Contains any private shared libraries and frameworks used by the executable

<http://tkchat.tcl-lang.org/>

Solution: Build Tcl/Tk - Framework

```
tclbuild.sh

#!/bin/bash

macosxminver=10.9
sver=868cp
ver=8.6.8
mver=8.6
tclmver=$mver
tkmver=$mver
SRCDIR=$HOME/t/tcl${sver}
INSTLOC=$HOME/t/localB

if [[ $1 != "" ]]; then
    INSTLOC=$1
fi

if [[ -d $INSTLOC ]]; then
    rm -rf $INSTLOC
fi
mkdir $INSTLOC

cd $SRCDIR

test -d build && rm -rf build

cd $SRCDIR
cd tcl${sver}
if [[ $? -eq 0 ]]; then
    f=library/init.tcl
    if [[ ! -f $f-orig ]]; then
        cp -pf $f $f-orig
    fi
    cp -pf $f-orig $f
fi

make -C macosx \
    PREFIX="" \
    CFLAGS_OPTIMIZE="-O2 -mmacosx-version-min=${macosxminver}" \
    INSTALL_ROOT=$INSTLOC install

cd $SRCDIR

chmod u+w $INSTLOC/bin/tclsh${tclmver}
install_name_tool -change \
    "/Library/Frameworks/Tcl.framework/Versions/${tclmver}/Tcl" \
    @executable_path/../Library/Frameworks/Tcl.framework/Versions/${tclmver}/Tcl \
    $INSTLOC/bin/tclsh${tclmver}
fi

cd $SRCDIR
cd tk${sver}
cd $SRCDIR
find $INSTLOC -type f -print0 | xargs -0 chmod u+w
exit 0
```

<https://gitlab.com/little-feather/macos-framework.git>

MacOS users, not only with a lower IT-background, demands a simple and intuitive installation process to install

with folders and files to provide individual apps with minimal external dependencies. Inside this, e.g., the Info.plist file executable key. In the context of Tcl/Tk-based apps, this could previously be a shell script (.sh) executing the final file that embeds both the Tcl interpreter and the application code.

ere built along this concept and previously worked well without any problems now violates the operating system's packaged apps, build by this concept, already fails the signing process and can no longer be notarized by Apple.

It turns out that this concept is no longer accepted by the security model of the new version of Apple's current desktop operating system. A new concept is needed. However, there are already Tcl/Tk-based applications that are compatible with the current operating system and also meet the requirements for Apple's code signing and notarization.

This manual is aimed at all Tcl developers creating applications for MacOS. It intends to give an insight into this currently uncommon approach, which works for both Tcl 8.6 and 9.0 and hopefully also fulfills the security requirements for Apple's future MacOS versions.

1 - Build Tcl/Tk Framework

```
./buildTcl__8.6.16.sh

ver=8.6.16
mver=8.6

cd tcl${ver}

make -C macosx \
  PREFIX="" \
  CFLAGS_OPTIMIZE=" -arch x86_64 -arch arm64 -mmacosx-version-min=${macosxminver}" \
  INSTALL_ROOT=$INSTLOC install

install_name_tool -change \
  "/Library/Frameworks/Tcl.framework/Versions/${tclmver}/Tcl" \
  @executable_path/../Library/Frameworks/Tcl.framework/Versions/${tclmver}/Tcl \
  $INSTLOC/bin/tclsh${tclmver}

cd tk${ver}

make -C macosx \
  PREFIX="" \
  CFLAGS_OPTIMIZE=" -arch x86_64 -arch arm64 -mmacosx-version-min=${macosxminver}" \
  INSTALL_ROOT=$INSTLOC install

install_name_tool -change \
  "/Library/Frameworks/Tk.framework/Versions/${tkmver}/Tk" \
  @executable_path/../../../../Tk \
  $INSTLOC/Library/Frameworks/Tk.framework/Versions/${tkmver}/Resources/Wish.app/Contents/MacOS/Wish

install_name_tool -change \
  "/Library/Frameworks/Tcl.framework/Versions/${tclmver}/Tcl" \
  @executable_path/../../../../../../../../Tcl.framework/Versions/${tclmver}/Tcl \
  $INSTLOC/Library/Frameworks/Tk.framework/Versions/${tkmver}/Resources/Wish.app/Contents/MacOS/Wish
```

2 - Build Application Bundle

```
./buildApp_A_makeApp_8.6.sh

APP_Name="myApp"
mver=8.6

cp -R      ${REPO_Dir}/myTemplate.app                                ./${APP_Name}.app
for libDir in ./${APP_Name}.app/Contents/Resources/Scripts/lib/__$mver}/*; do
    mv $libDir ./${APP_Name}.app/Contents/Resources/Scripts/lib
done
rm -Rf     ./${APP_Name}.app/Contents/Resources/Scripts/lib/__$*

rsync -av  ./install_${mver}/Library/Frameworks                    ./${APP_Name}.app/Contents
# rsync -av ./install_${mver}/Library/Tcl                          ./${APP_Name}.app/Contents/Library

cp         ./install_${mver}/Library/Frameworks/Tk.framework/Resources/Wish.app/Contents/MacOS/Wish    ./${APP_Name}.app/Contents/MacOS/
cp         ./install_${mver}/Library/Frameworks/Tk.framework/Versions/Current/Resources/Tk.icns        ./${APP_Name}.app/Contents/Resources/

install_name_tool -change \
    @executable_path/../../../../Tk \
    @executable_path/../../../../Frameworks/Tk.framework/Versions/${tkmver}/Tk \
    ./${APP_Name}.app/Contents/MacOS/Wish

install_name_tool -change \
    @executable_path/../../../../../../../../Tcl.framework/Versions/${tkmver}/Tcl \
    @executable_path/../../../../Frameworks/Tcl.framework/Versions/${tkmver}/Tcl \
    ./${APP_Name}.app/Contents/MacOS/Wish

rm -Rf     ./${APP_Name}.app/Contents/Frameworks/Tk.framework/Versions/${tkmver}/Resources/Documentation
rm -Rf     ./${APP_Name}.app/Contents/Frameworks/Tk.framework/Versions/${tkmver}/Resources/Wish*
```

3.1 - Codesigning & .zip for Notarization

```
./buildApp__B__createZip.sh

REPO_Dir=$(pwd)
APP_Name="myApp"

cp -Rf ${APP_Name}.app ./build/${APP_Name}.app

vtool -show-build ./build/${APP_Name}.app/Contents/MacOS/Wish
otool -L          ./build/${APP_Name}.app/Contents/MacOS/Wish

xattr -cr ./build/${APP_Name}.app

python3 -mmacholib standalone ./build/${APP_Name}.app

tkmver=$(echo $(ls -l ${APP_Name}.app/Contents/Frameworks/Tk.framework/Versions/Current) | awk -F ' ' → ' '{print $2}')

rm -rf ./build/${APP_Name}.app/Contents/Frameworks/Tcl.framework/Versions/${tkmver}/Resources/Documentation
rm -rf ./build/${APP_Name}.app/Contents/Frameworks/Tk.framework/Versions/${tkmver}/Resources/Documentation

find ./build/${APP_Name}.app -name "*.a"      -exec rm -rf {} \;
find ./build/${APP_Name}.app -name "*debug"   -exec rm -rf {} \;
find ./build/${APP_Name}.app -name "*.sh"     -exec rm -rf {} \;

rm -rf ./build/${APP_Name}.app/Contents/Frameworks/Tk.framework/Versions/${tkmver}/Resources/Wish.app
rm -rf ./build/${APP_Name}.app/Contents/Frameworks/Tk.framework/Versions/${tkmver}/Resources/Wish Shell.app"

security unlock-keychain login.keychain

find ./build/${APP_Name}.app -type f -name "*.bundle" -exec \
    codesign --verbose -f ...

codesign --verbose -f ... ./build/${APP_Name}.app/Contents/Frameworks/Tk.framework/Versions/Current
codesign --verbose -f ... ./build/${APP_Name}.app/Contents/Frameworks/Tcl.framework/Versions/Current
codesign --deep --verbose=2 ... \
    --options runtime \
    --entitlements ${REPO_Dir}/sources/entitlements.plist \
    ./build/${APP_Name}.app

/usr/bin/ditto -c -k --keepParent ./${APP_Name}.app ../${APP_Name}.app.zip
```

- **otool**
... displays specified parts of object files or libraries.
- **vtool**
... displays and edits build and source version numbers embedded in the Mach-O(5) file format.
- **xattr**
... display and manipulate extended attributes of one or more files, including directories and symbolic links.
- **python -mmacholib**
... can be used to analyze and edit Mach-O headers
- **codesign unlock-keychain**
... access Developer-ID
- **codesign**
.... codesigning utility
- **ditto**
... copy directory hierarchies, create and extract archives

3.2 - Upload App.zip for Notarization

buildApp__C__submitZip.sh

```
APP_Name="myApp"  
SIGN_Profile="myNotarizationProfile"
```

```
codesign -dvv --entitlements - ./build/${APP_Name}.app
```

```
spctl --assess --verbose ./build/${APP_Name}.app
```

```
xcrun notarytool submit \  
    "./${APP_Name}.app.zip" \  
    --keychain-profile $SIGN_Profile \  
    | tee log_c_submit.log
```

- **codesign**
.... codesigning utility
- **spctl**
... manage the security assessment policy subsystem
- **xcrun**
... run Xcode tools

3.3 - Staple Ticket to App and create DiskImage

buildApp_D_stapleApp.sh

```
APP_Name="myApp"
SIGN_Profile="myNotarizationProfile"

SUBMIT_ID=$(grep "id:" log_c_submit.log | awk '{print $2}' | sort | uniq)
echo "      ${SUBMIT_ID}"

xcrun notarytool log "$SUBMIT_ID" \
    --keychain-profile $SIGN_Profile \
    | tee log_d_status.log

head -10 log_d_status.log

SUBMIT_Status=$(grep "\"status\": log_d_status.log | grep Accepted | awk '{print $2}')"
echo "      ${SUBMIT_Status}"

xcrun stapler validate      ./build/${APP_Name}.app
xcrun stapler staple       ./build/${APP_Name}.app
xcrun stapler validate     ./build/${APP_Name}.app
spctl -vvv --assess --type exec ./build/${APP_Name}.app

hdiutil create \
    -volname "${DMG_Name}" \
    -srcfolder ./${APP_Name}.app \
    -ov \
    -format UDZO \
    ../${DMG_Name}.dmg
```

- **xcrun**
... run Xcode tools
- **spctl**
... manage the security assessment policy subsystem
- **hdiutil create**
... create and manipulate disk images
